

5. Methods

5.1. Protocol Registration

This protocol will be registered on an international prospective register of systematic reviews (**PROSPERO** at <https://www.crd.york.ac.uk/prospero>). Any significant amendments will be documented and explained in the final report.

5.2. Eligibility Criteria (PICO Framework)

PICO	Inclusion Criteria	Exclusion Criteria
Population	<ul style="list-style-type: none"> patients diagnosed as multilevel (2 or 3) cervical degenerative disc disease indicated for anterior cervical discectomy Adults (≥ 18 years) No restriction on sex or ethnicity. 	<ul style="list-style-type: none"> Animal studies In vitro human studies (including cadaver material). studies including other pathologies than degenerative cervical disc disease like (neoplastic, infection, trauma) Revision surgery studies including single level or undetermined number of operated levels studies reporting on special populations (e.g. Pregnant women).
Intervention	<ul style="list-style-type: none"> Hybrid surgery (HS): defined as combination of ACDF and cervical disc arthroplasty (CDA) at adjacent levels. 	<ul style="list-style-type: none"> Studies defining hybrid surgery other than combination of CDA+ACDF (e.g. corpectomy + ACDF)
Comparison	<ul style="list-style-type: none"> Anterior Cervical Discectomy and Fusion (ACDF) 	<ul style="list-style-type: none"> studies not comparing HS to ACDF
Outcomes	<ul style="list-style-type: none"> containing at least one efficacy (primary) and one safety (secondary) outcome measure: <p>1-primary outcomes: Neck Disability Index [NDI], pain Visual Analog Scale [VAS], Japanese Orthopedic Association [JOA] score, Odom criteria, cervical overall range of motion, superior and inferior adjacent segments range of motion.</p> <p>2.secondary outcomes: blood loss, operation time, and complications (adjacent segment disease [ASD], heterotopic ossification [HO], Dural/cord injury, C5 palsy, implant subsidence, dysphagia/dysphonia, hematoma, infection)</p>	<p>Studies that did not report relevant outcome measures</p>

- **Additional Sources**
 - Reference lists of included studies and relevant review articles will be hand-searched for additional eligible articles.
 - Grey literature sources (e.g., ClinicalTrials.gov, Google scholar) may be searched if feasible.
 - Consultation of field expert is considered in our search strategy, as well as contacting of study authors for full data when required (by email to corresponding author; 2 emails with 2 weeks interval).

5.4 Study Selection Process

1. **Screening**
 - Duplicate records removal by reference manager software (EndNote) double checked with manual comparison done by first and second authors.
 - Two independent reviewers (first and second authors) will screen titles and abstracts to exclude irrelevant studies.
 - Potentially eligible full-text articles will then be retrieved for detailed assessment.
2. **Eligibility Confirmation**
 - The same two reviewers will independently apply the inclusion criteria to the full-text articles.
 - Discrepancies will be resolved by consensus or by consulting a third reviewer (the third author; professor Mahmoud Taha, head of neurosurgery department, Zagazig University, Zagazig, Egypt).
3. **PRISMA Flow Diagram**
 - We will document the selection process using a PRISMA flow diagram, detailing the number of records identified, screened, included, and excluded (**with reasons of exclusion and a full list of excluded records will be saved in a supplementary file**).

5.5 Data Extraction

- **Data Extraction Form**
 - A standardized spreadsheet on Excel software will be used to collect:
 - Study characteristics (authors, year, country, design, sample size, source of funding of each individual study).
 - Patient demographics (age, sex, diagnosis criteria, comorbidities).
 - Intervention details (levels treated, type of implants/devices used).
 - Outcomes of interest (NDI, VAS, ROM, complications, etc.).
 - Length of follow-up.
 - Two reviewers will extract data independently (first and third authors). Any disagreements will be resolved by discussion.
 - The data extraction sheet will be available as supplementary file.

5.6 Risk of Bias Assessment

- **RCTs**
 - We will use the **Cochrane Risk of Bias 2 (RoB 2)** tool to assess randomization, allocation concealment, blinding, incomplete outcome data, selective reporting, and other potential biases.
- **Non-Randomized Studies**
 - We will use the **ROBINS-I** (Risk Of Bias In Non-randomized Studies of Interventions) tool or **MINORS** (Methodological Index for Non-Randomized Studies) for cohort studies, as appropriate.
